Claws is a lightweight email client with mail storage in a searchable database.

In this example we create an Exetel account for J. Smith whose email address is <u>smith@exemail.com.au</u>. From the main menu bar, select **Configuration->Create New Account**. A popup will be displayed with tabs in a sidebar. **Basic** is the most important, filled in like this (use the appropriate state for the server):

۵.	J. Smith - Account preferences	_ 🗆 ×
Page Index	Basic	
	Name of account J. Smith Set as default	
Basic	Personal information	
Send	Full name J. Smith	
Compose	Mail address smith@exemail.com.au	_
Templates Privacy	Organization	
SSL	Server information	
Advanced	Protocol: POP3	
	Server for receiving pop3.nsw.exemail.com.au	
	SMTP server (send) smtp.nsw.exemail.com.au	
	User ID smith@exemail.com.au Password	
	√ Apply Signature	<u>9о</u> к

You can tick default if that is desired for the account. Other accounts can be added at any time.

The next tabs are **Receive** and **Send**. Default settings are good. NB: No authentication on Send.

You can configure **Compose** and **Templates** to your preferences. **Privacy** (encryption) requires GPG to be installed separately in the computer. Ensure that the settings in **SSL** are as below (ie, **Don't use SSL**).

*	J. Smith - Account preferences	- 0 ×
Page Index	SSL	
✓ Account	POP3	
Basic	Don't use SSL	
Receive	 Use SSL for POP3 connection 	
Send	 Use STARTTLS command to start SSL session 	
Compose		
Templates	Send (SMTP)	
Privacy	Don't use SSL (but, if necessary, use STARTTLS) Use SSL for SMTP connection	
SSL	Use STARTTLS command to start SSL session	
Advanced	Use STARTIES command to start SSL session	
	Use non-blocking SSL Tum this off if you have SSL connection problems	
	✓ Apply Sancel	<u>9</u> ок
